

Our one-switch ($W = 16$, $\rho = 0.25$) | Window ($W = 16$) | Hedge (rate $\times 4$)

Expected cumulative cost difference, $\Delta C_b(t)$

(a) Our one-switch – Window

Policy-selection round, t
Expected native cost for reset 50-step episodes; negative values favor our method.

Bands: descriptive pointwise 95% intervals, conditional on calibration.

(b) Our one-switch – Hedge
